A traditional CAD program usually consists of: A drawing area, usually showing a three-dimensional (3D) model of an object or scene A collection of drawing commands and

options, or a "toolbox" A component library for storing commonly used components and designs A drawing history or "palette" A command line interface, or CLI, to initiate and modify the drawing process A number of specialized

tools, which allow a user to measure, annotate, and annotate drawings A drawing-graphics subsystem, which renders (draws) the objects on screen Read the following list to see how this information

corresponds to the components you've seen in the CADR5D project: Introduction to CADR5D What to Learn In this project, we'll be working with the AutoCAD-like program called STAR RANGER, a 3D, parametric modeling

software program for creating 3D models in the cloud. Star Ranger can work with objects and models created with various software programs, including: In this project, we'll be using a form you've already started, and

modifying it with the STAR RANGER program. Later, we'll work to improve the 3D model and save it as a file you can open in AutoCAD. In Part 1 of this project, you learned how to set up a 3D modeling software program like

STAR RANGER, and how to modify an existing drawing. You also learned how to use the drawing tools and customize the interface. In Part 2 of this project, you'll learn how to work with 3D components and files. In Part 3 of

this project, you'll learn how to save and open a drawing in AutoCAD or the AutoCAD Lite client. Read the What to Learn section of this tutorial to learn more about the topics we'll cover in this project. Create a STAR
